

## Project Summary

The purpose of this website is to act as a central online resume for a software engineer. The goal is to show off front end development skills and at the same time provide a way to view a resume and a record of all relevant projects. The users of this application would be anyone looking to hire this developer or for a recruiter to find out more information about the developer. A few of the key features are the 'Contact Me' page and the 'Portfolio' page. The goal of these pages is to showcase the projects and technologies the developer knows and how to contact the developer if someone is interested in their services.

For this iteration, I made a few interactions that only center around polish and visual appeal. My goal was to add small features that would make the website feel more purposeful. Given the nature of this website things like submitting feedback and changing between the main and alternate view for the portfolio have been implemented. Besides that, I moved from a mockup navbar to a functional one that appears and disappears cleanly and made the scrolling interpolate to a point rather than snapping. I tried to make a more interesting landing page by adding a design element that would appear behind the mouse, but it is far from how I envisioned it so a lot of work is needed on it. My goal now is to clean up some bad practices and fully apply polish and some API connections next time.
