Project Summary

The purpose of this of this website is to act as a central online resume for a software engineer. The goal is to show off front end development skills and at the same time provide a way to view a resume and a record of all relevant projects. The users of this application would be anyone looking to hire this developer or for a recruiter to find out more information about the developer. A few of the key features are the 'Contact Me' page and the 'Portfolio' page. The goal of these pages is to showcase the projects and technologies the developer knows and how to contact the developer if someone is interested in their services.

I made a few minor changes but most of the compliance issues mentioned in the feedback pertain to the core layout of the website. This website, while multiple pages, is meant to be scrolled through rather than clicked through. The bulk of the navigation will be done with the scroll wheel, so when I use JavaScript I would like to add some "hints" on how the website works. Besides navigation violations there is nothing that can be done on the resume page. I plan to fix this by allowing the downloading / email of the PDF, but I cannot do that without JavaScript.
